The Science: Spatial capture-recapture methods represent an extension of classical capture-recapture and allows for both the spatial organization of sampling.

Spatial capture-recapture (SCR) modelling | Centre for Statistics in Ecology, the Environment

Spatial capture-recapture modelling (SCR) is a powerful analytical tool to estimate density and derive information on space use and behaviour.

Spatial capture-recapture (SCR) models are commonly used for analysing data collected using noninvasive genetic sampling (NGS).

However, none of the approaches have proved to be satisfactory and this led to the development of spatial capture recapture (SCR) models, which incorporate.

Spatial Capture-Recapture by Royle et al. provides a detailed introduction to the concepts and statistical approaches as well as a how-to guide.

In this overview we show how spatial models are central to modern distance sampling and that spatial capture-recapture models arise as an.

Recently developed spatial capture-recapture (SCR) methods are well suited to standard herpetofauna monitoring approaches. Individually identifying animals.

To estimate the density of wildcats, we used Bayesian inference in a spatial capture-recapture model. We used WinBUGS to fit a model that.
