I found a couple of solutions that helped in my situations; perhaps they will help you in similar situations. We usually recommend implementing filtering of rows in a database table using the database. The grid also works with map books to use it just create the grid in your map book layout template file. They are more than happy to set up exactly how they want the data to look and how to. An entry should appear for your table and each geometry column. This didn't solve the problem either, since pipes that cross suburb boundaries will produce multiple result rows. To check the existence of a spatial index on your table run the following SQL query into Preview mode and do a Refresh to verify your new Table or View is available, along with the correct Columns representing your geometric data....
